You can't switch the default printer from within DEFSET. You have to use different software for this task. As you might have guessed, DEFSET is set up to be a program for working with settings in Windows. The program is not meant for general use but rather to get the needed default printer to automatically use when a print job is completed. The name is based on the *SET directive of the *INI file, which provides the means for changing the settings. The print process will be set as the default if it has been identified as the default printer during the installation of DEFSET. Before you can use DEFSET, you will have to unzip it and double-click the.exe file. The main window should open up right away with two buttons. The dialog box can be found on the bottom-left corner. Click on "Quit" and the DEFSET tool will close. On the other hand, you can click on "System tray" which will do the same thing and it will stay there. However, it will not quit directly. You need to press Ctrl+Alt+Del keys to get rid of it. Thanks to the tool, you can quickly change the default printer used by your computer, regardless of whether you have to print to a PDF file, an e-mail, or a document, or whatever it is that you do in a computer.
