Opening a file Your first step is to open the file. After you open the file, you can work with it, using the program's tools, and create changes to the image. This process is familiar to anyone who has used word-processing applications or any other type of software that lets you open documents. If the file you want to open is a JPG or JPEG file, you start the process by opening it. You do so by selecting the image or clicking its thumbnail in its window. Then click Open. This enables you to see the image in the program's main window or window. If you want to make a change to the actual colors in the image, you can open it in its original state, called the \_source\_, and make a change. Later on, you can open the image in the new version, but the original image is still open. This enables you to compare the original version to the later changes you make. If the file is a TIFF, PSD, or RAW file, you need to open it in one of the following formats: \* Photoshop \* Adobe Photoshop Extended (PSE) \* Adobe Camera Raw (ACR)

Apple has opened up the APIs that it uses to measure iPhone battery life, in an effort to help developers create more accurate battery life estimators. The first change is when you look at your battery usage in Settings, you'll now be able to see how your usage over the past 24 hours differs from your usage over the last seven days. So if you're seeing a drop in usage that's not reflected in your usage over the last seven days, there's something you're doing that is skewing the results. The other API change is more subtle, and appears to be more like a feature. If you want to see if there is a difference in your iPhone's battery life, you'll now be able to do so on a per app basis. There are two different things you can do: first, you can select an app and look at its battery usage over the past 24 hours. The second is to look at the battery usage per app over the last seven days. Apple says that the changes are a way of making Apple's own battery life tracking and measurement results more accurate. It's unclear if the number of iPhone users that are able to do this is high enough to make much of a difference, but some developers are already taking advantage of the improved battery usage data. The big change that could potentially affect users is the ability to use the data to tweak apps. Many apps don't clean up correctly when idle, and the data that Apple is now allowing developers to analyse could help developers develop apps that do better with inactive periods. If the trend continues, we could see apps that are more aware of their battery usage, and apps that work to save battery while in idle periods.

**Brushes** Brushes can be used to create specific effects and look or colorize images. You can use a paint brush to create an airbrushed look with many different brushes with various colors available. There are many different types of brushes, many with customizable settings. Select the Brush Tool (B) from the Tools palette and click on an area of the image you want to start painting with the brush. Click the left mouse button again to create the first point of the brush. Now move the brush along the path the mouse has selected, either by moving the mouse up and down or left and right. A new window will appear with the current position of the mouse and the points selected. You will see little dots that represent pixels in the image. You can change the number of lines that this brush has by clicking on the dot and pushing the up or down arrow buttons. You can also change the color of the brush by changing the color of the line.

**Masking** Animated masks are created by using the Pen tool (P) and paths. You can draw a new path to mask a specific object or portion of an image. To create a new path, hold down the Ctrl (Windows) or Cmd (Mac) key and click and drag across the image to create a new path. When you have created the path, release the mouse button. Photoshop will create a new mask which will allow you to paint only on the area of the image covered by the path. The area below the path will be blocked from paint.

**Drawing Rectangles and Circles** Select the Pen tool (P) from the Tools palette and click to start drawing. The Pen tool allows you to draw a rectangle and modify its size and dimensions by using the arrows on the pen. You can also draw free-form paths using the Pen tool. You can also use the Pen tool to create a circle. Hold down the Shift key as you click to constrain the movement to a circle instead of a rectangle. Once you've created a new shape, click on the Shape Layers icon (which looks like a paper clip) to create a new layer and name it. Place it over the area that you want to mask and using the Eraser, erase parts of the image underneath.

**Creating and Modifying Text** Creating text is a basic part of Photoshop. You can add text to an image using either the Type tool (T) or text box
