the interval units are seconds and minutes. by default the interval is set to 1 year. you will have an opportunity to change the interval time in simulated time before you start managing the patient. you can also change a patient's location, request a follow-up appointment and see results. if you wish to change any of these options, you must press the enter key. you can request a follow-up appointment, as well as change patient's age, gender, or medications before or during the simulation. a follow-up appointment will appear before or during the next update. you can specify a time and date or enter the day and month only. the choose a procedure icon will appear before or during the update with the list of available procedures. to choose a procedure, you must click on the icon. you can also enter a procedure in an update by pressing the enter key. procedures appear after the selected procedure icon. to choose a procedure, you must click on the icon. you can also enter a procedure by pressing the enter key. next to each procedure is the name, description, and the time required to complete the procedure. if you wish to change the medications after you select a procedure, click the + icon. you can also change medications before or during the update by clicking on the + icon. next to each medication is the name, description and the amount it should be administered. you can select a medication before or during the update by clicking on its icon. you can also change medications during the simulation by pressing the enter key. you cannot ask for a change during a test because it cannot be done.

the timing and sequencing of indicated actions, as well as the commission of actions that are not indicated or are potentially harmful, are aggregated in your evaluation. indicated patient management actions are weighted based on degree of appropriateness and may increase your score by different amounts. actions that are not indicated and pose greater potential risk to a patient decrease your score by greater amounts than do actions of lower risk. seemingly correct management decisions made in a suboptimal or incorrect sequence or after a delay in simulated time may receive little or no credit. note that some orders (eg, counseling, diet, ambulation) tend to carry little or no weight in scoring unless they are particularly relevant to the case (eg, specific diet orders for a patient with diabetes). i recently completed a large distribution center modeling project using flexsim simulation software. i was extremely impressed by the support that i received and the flexibility of flexsim to model this complex (and massive) system. all of the previously mentioned programs are based on the glsl language. this is a powerful modeling language that lends itself to the simulation of computer graphics and glsl (the opengl shading language) is the core language of these programs. i've used most of these modeling programs. i have been a student of computer programming for many years, and i am familiar with most of them. i am not a student of simulation or modeling and i use them mainly to produce high quality designs and to understand the modeling process. if you are new to the modeling and simulation world, i highly recommend the modeling courses offered by macquarie university. i have taken three courses and found them very useful. i would also recommend that you read the wonderful books and papers written by the leaders in this
